

Open-Source software is a type of software that can be freely used, modified, and distributed according to the guidelines associated with its respective copyright. We contributed to an open-source project called TEAMMATES -- a peer evaluation tool used by over 1,600 universities and educational institutions around the globe. Collectively, we have added documentation and fixed several bugs throughout the project. These bug fixes include, but are not limited to: improving functionality by ensuring that feedback forms revert appropriately when refreshed, increasing consistency by reformatting numbers to show a uniform number of decimals, and improving usability by modifying a feature to copy questions in a more intuitive way. Through our work we have gained experience in end-to-end testing, following git workflow, and how to join an established project and navigate the structures and procedures that are in place.
